### Introduction to

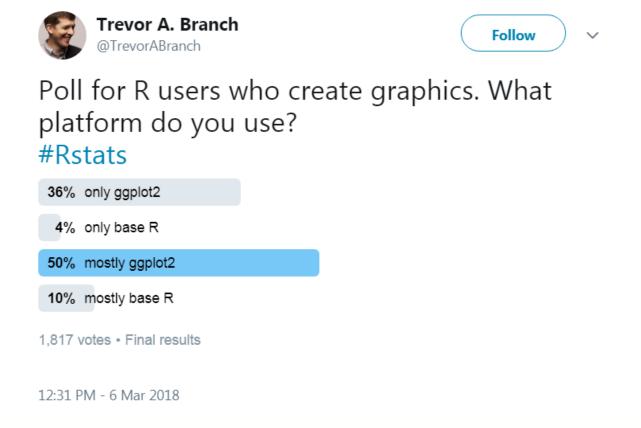

# Acknowledgement

This session shadows Chapter 3 of the excellent:

## ggplot2

Is one of several plotting systems in R

# Why is ggplot popular?

- 1. Well designed and supported
- 2. Highly versatile
- 3. Attractive graphics (with a little work)

<sup>1.</sup> Why start with ggplot: <a href="http://varianceexplained.org/r/teach">http://varianceexplained.org/r/teach</a> ggplot2 to beginners/

<sup>2.</sup> Argument against: <a href="https://simplystatistics.org/2016/02/11/why-i-dont-use-ggplot2/">https://simplystatistics.org/2016/02/11/why-i-dont-use-ggplot2/</a>

# ggplot2

ggplot2 is part of the tidyverse.

So, at the top of your script type:

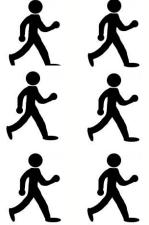

library(tidyverse)

### Project 1:

Let's explore a perennial challenge for the NHS:

#### Pressures in A&E

Demand

# Data: Capacity in A&E

The dataset we loaded earlier, capacity\_ae<sup>1</sup>, shows changes in the capacity of A&E departments from 2017 to 2018.

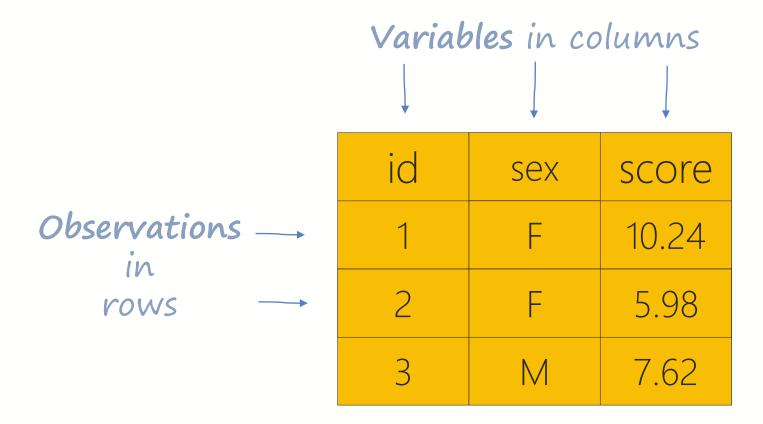

1. Closely based on datasets collected by the NHS Benchmarking Network

# Data: Capacity in A&E

The object named capacity\_ae is a data frame.

### What is a data frame?

A data frame stores tabular data:

### tibble = data frame

In the tidyverse you may see the term "tibble".

We'll take "tibble" to be synonymous with "data frame"

id	sex	score
1	F	10.24
2	F	5.98
3	M	7.62

## Viewing the data frame

```

# Viewing the data frame

This brings up a view of the data in a new tab:

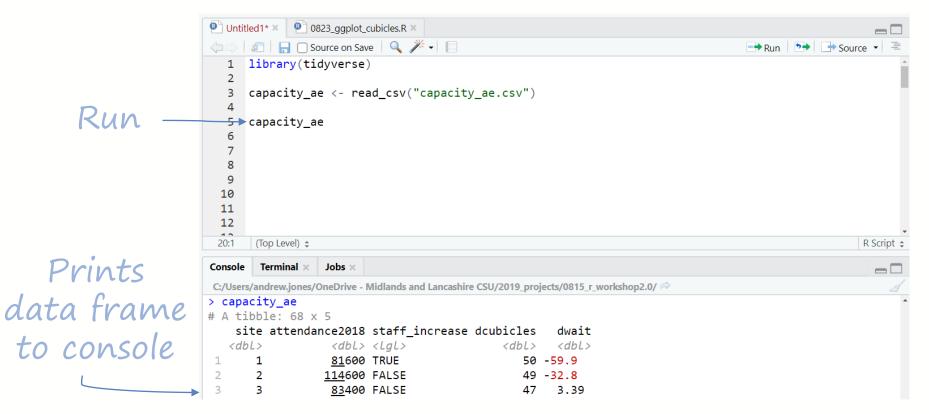

# Viewing the data frame

Click here to show the data frame in a new window\*

# Viewing data: Option 2

Type the name of the dataset in editor/console, and run the line (Ctrl + Enter).

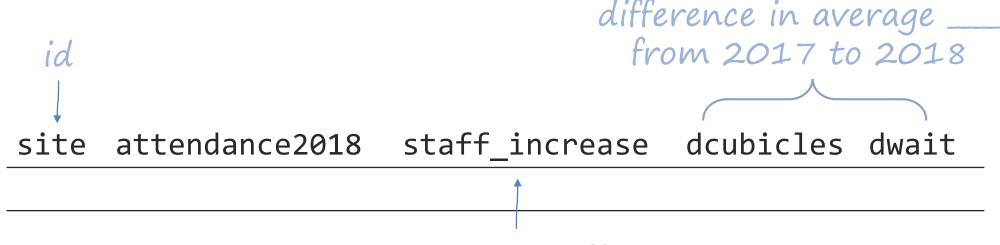

# Q1. How many sites?

# Q2. Do we understand the variable names?

(and what they mean)

# Q1. How many sites?

# Q2. Do we understand the variable names?

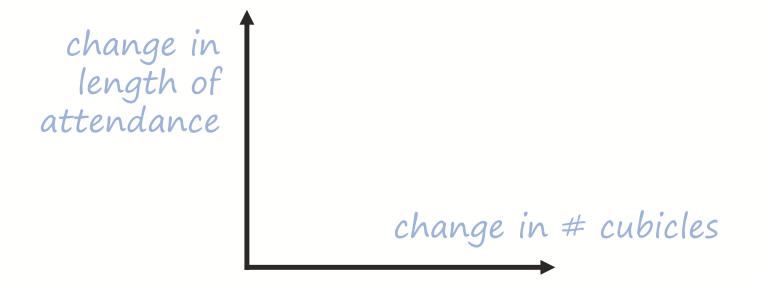

Did # staff increase between 2017 and 2018 "The simple graph has bought more information to the data analyst's mind than any other device"

- John Tukey

# Graphics with ggplot2

Q. Is a change in the number of cubicles available in A&E associated with a change in length of attendance?

Q. Is a change in the number of cubicles available in A&E associated with a change in length of attendance?

```
R is case
sensitive
```

Note that

```
ggplot(data = capacity ae) +
  geom_point(aes(x = dcubicles, y = dwait))
```

### Breakdown

```
1. We begin our

plot with
ggplot()

ggplot()

ggplot(data = capacity_ae) +

geom_point(aes(x = dcubicles, y = dwait))
```

# How do we move from data to graphic?

(Pen and paper exercise)

# Create a graphic from the data below:

(Pen and paper exercise)

year	time (sec)
1930	12.0
1960	11.3
1990	10.5

# Create a graphic from the data below.

Now, try to note down all the subtle (unconscious?) choices you made when creating your graphic.

year	time (sec)
1930	12.0
1960	11.3
1990	10.5

1. What shape will represent the data?

1. What shape will represent the data?

- 1. What shape will represent the data? (geom)
- 2. What visual (aesthetic) attributes do we give to the geom?

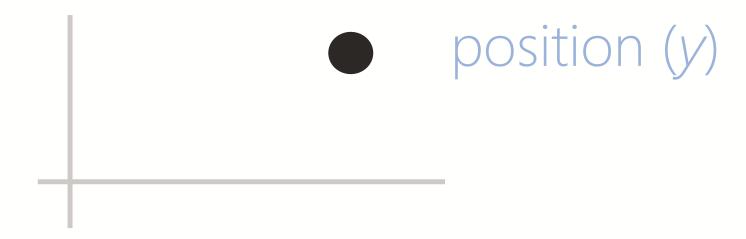

- 1. What shape will represent the data? (geom)
- 2. What visual (aesthetic) attributes do we give to the geom?

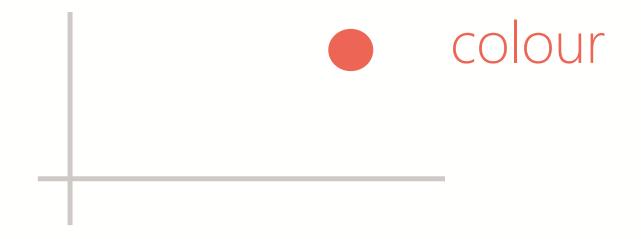

- 1. What shape will represent the data? (geom)
- 2. What visual (aesthetic) attributes do we give to the geom?

- 1. What shape will represent the data? (geom)
- 2. What visual (aesthetic) attributes do we give to the geom?

- 1. What shape will represent the data? (geom)
- 2. What visual (aesthetic) attributes do we give to the geom?

### A statistical graphic

(aesthetic attributes of)

Data variables -> geometric objects.

## A statistical graphic

(aesthetic attributes of)

Data variables -> geometric objects.

```
ggplot(data = capacity_ae) +
geom_point(aes(x = dcubicles, y = dwait))
```

Here, other aesthetic properties (size, colour, etc.) are set by default 35

### Functions ()

ggplot(), geom\_point(), and aes() are functions.

Running a function does something

Functions are given zero or more inputs (arguments)

Arguments of a function are separated by commas

### Functions ()

You can name arguments explicitly;

```
ggplot(data = capacity_ae) + ...
```

Or not:

(provided you have the arguments in the correct order!)

### Functions ()

Here, we have provided

ggplot() with one

named arguments

Unspecified (yet required) arguments will often revert to default values

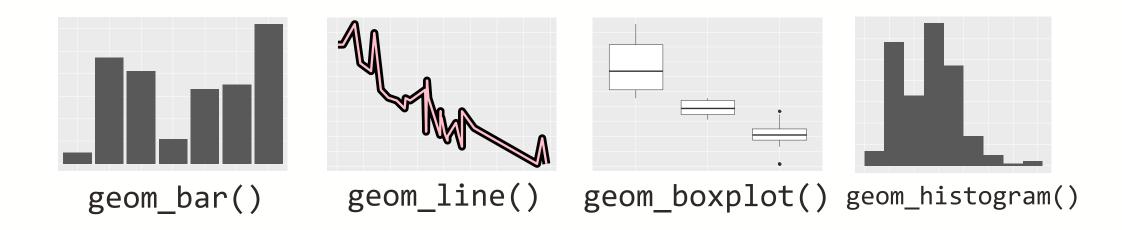

#### Shorthand

Since ggplot2 knows the order of essential arguments, I will largely stop naming arguments from now on. So:

```
ggplot(capacity_ae) +
   geom_point(aes(dcubicles, dwait))
   x goes first  y goes second
```

### geoms

We tend to describe plots in terms of the *geom* used:

## Layering geoms

We can display more than one geom in a plot:

```
to add a layer
ggplot(capacity ae) +
  geom_point(aes(dcubicles, dwait)) +
  geom_ _ (aes(dcubicles, dwait))
     then specify another geom
```

#### Your turn

This is our current plot:

```
ggplot(data = capacity_ae) +
   geom_point(aes(x = dcubicles, y = dwait))
```

Add a **geom\_smooth** layer (to help identify patterns)

Hint: Don't forget the aes() values in the new layer Extension: If you prefer, re-write in shorthand

#### Your turn

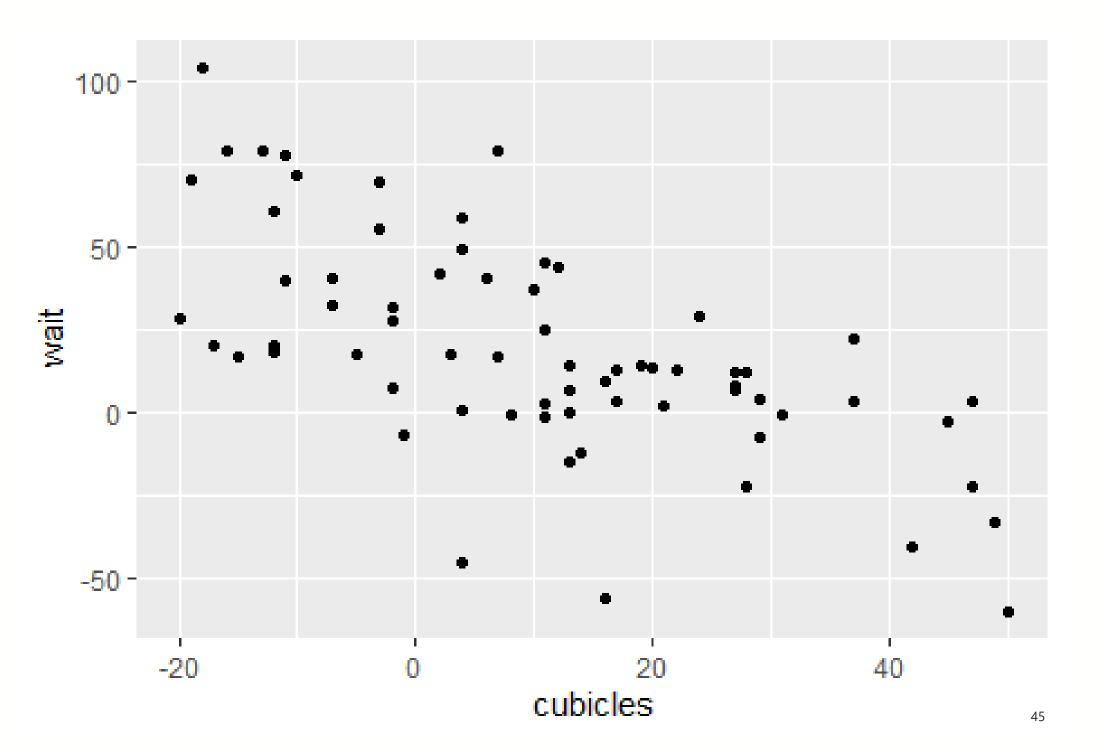

A geom\_smooth layer can help us identify patterns. Add geom\_smooth() to our current plot:

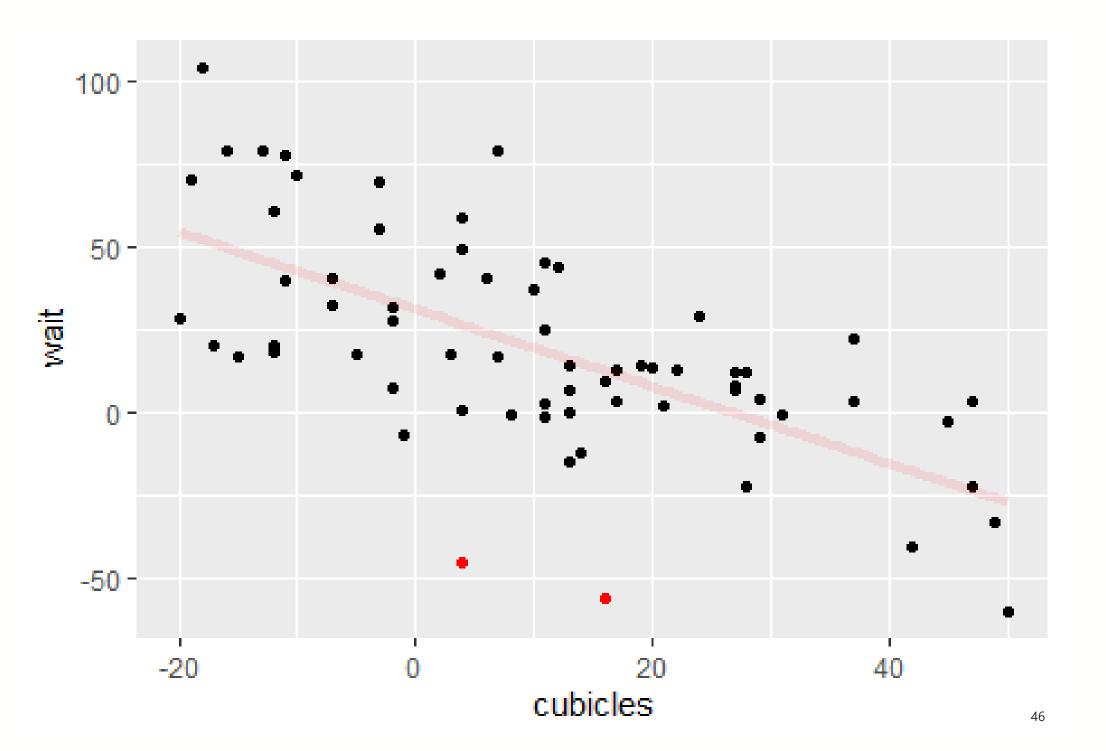

```
ggplot(data = capacity_ae) +
geom_point(aes(x = dcubicles, y = dwait)) +
geom_smooth(aes(x = dcubicles, y = dwait))
```

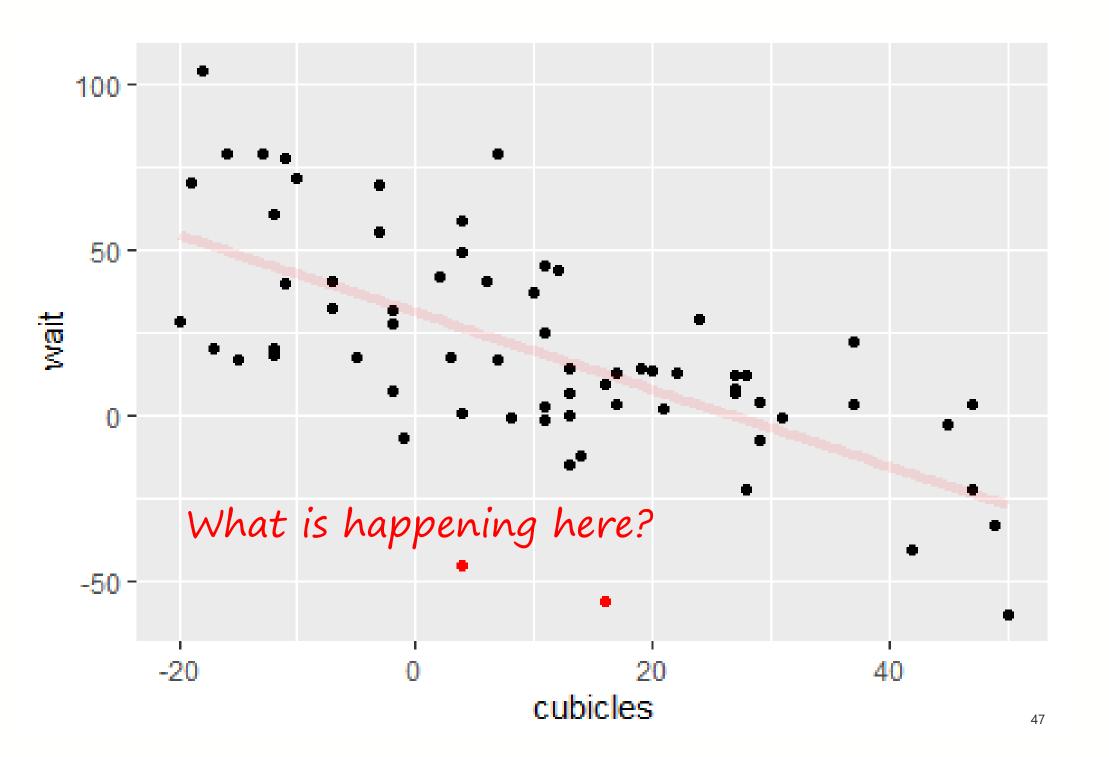

## One more thing

We'd probably prefer a linear fit rather than the loess (non-linear) fit:

```
ggplot(capacity_ae)+
geom_point(aes(dcubicles, dwait)) +
geom_smooth(aes(dcubicles, dwait),
method = "lm") \____Fit a linear model
```

### Ideas?

## Hypothesis

The two sites have seen staffing increases

aesthetic attribute

We can map point **colour** to the **staff\_increase** variable to find out.

So each point is given a colour which will depend on the value of **staff\_increase**.

## Adding another dimension

Put an argument <u>inside</u> **aes()** if you want a visual attribute to change with different values of a variable.

shape - but these make graphic less clear 50

#### Outcome

The two sites in question have indeed seen an increase in staff levels.

## Important distinction

If you want a visual attribute to be applied across the whole plot, the argument goes <u>outside</u> **aes()** 

## Important distinction

If you want a visual attribute to be applied across the whole plot, the argument goes <u>outside</u> **aes()** 

## Small multiples

Another way to visualise the relationship between multiple variables is with a **facet\_wrap()** layer:

2. Then, tell facet\_wrap you want a panel for each category of "staff level"

## Small multiples

Another way to visualise multiple variables simultaneously is with a **facet\_wrap()** layer:

# Demonstrating geoms: (note: these are simple, unpolished graphics)

# Q. How are "wait" values distributed? Histogram

```
ggplot(capacity_ae) +
  geom_histogram(aes(dwait))
```

# Q. How are "wait" values distributed? Histogram

# Q. Number of attendances by site? Bar plot

# Q. Number of attendances by site? Bar plot

# Q. Distribution of "wait" for each value of staff level? Box plot

```
ggplot(capacity_ae) +
  geom_boxplot(
  aes(staff_increase, dwait))
```

#### Plot labels

```
ggplot(capacity ae) +
  geom boxplot(aes(staff increase, dwait))+
  labs(
      title = "Do changes in staffing ...",
      y = "Waiting time"
```

By default: saves a plot in the same dimensions as plot window.

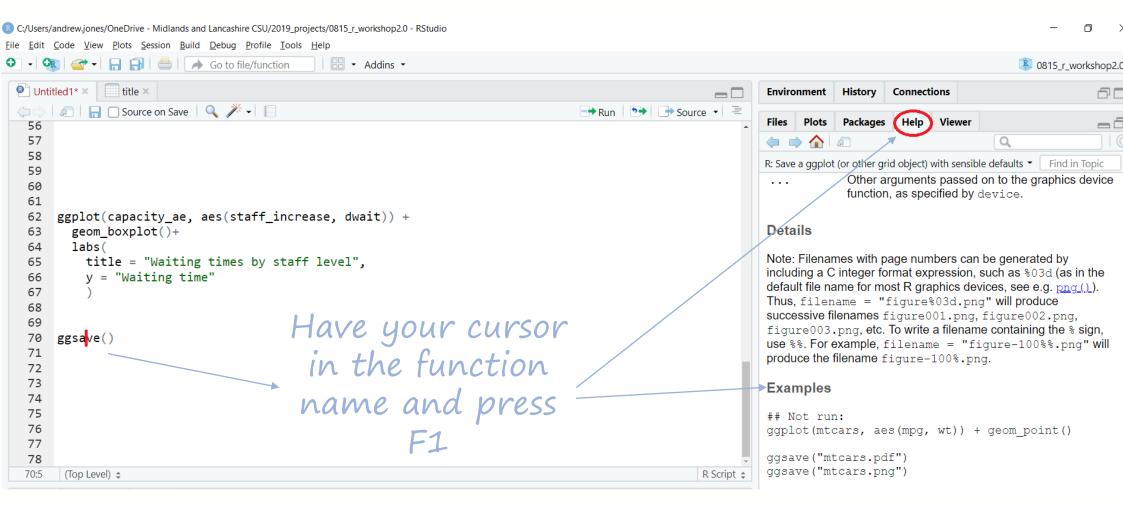

In future, you'll wish to add height, width and "units" arguments to specify plot dimensions:

```
ggsave(plot_name.png, units = "cm",
height = 10, width = 8)
```

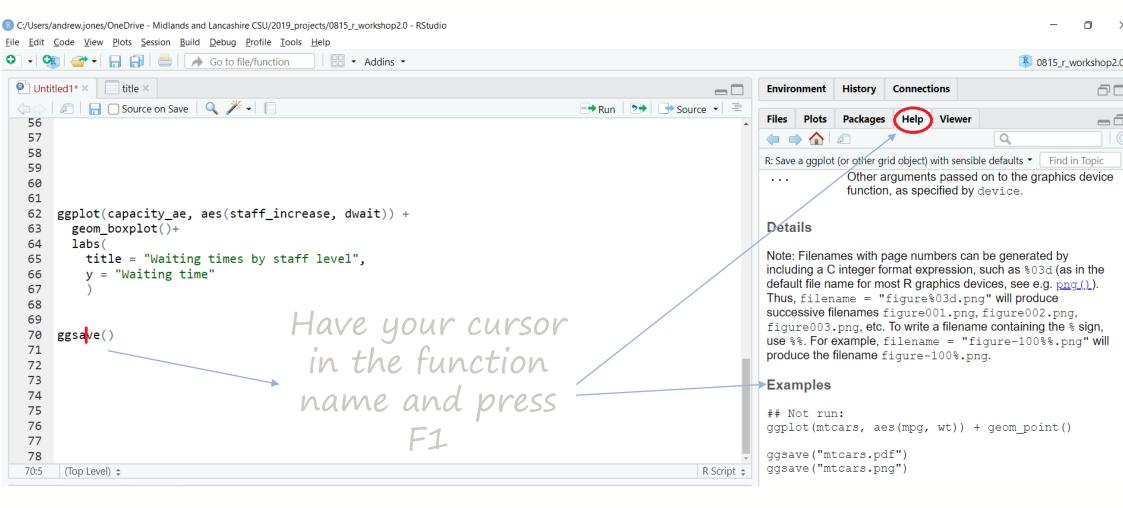

### What does this function do?

```

    62
         ggplot(capacity ae, aes(staff increase, dwait)) +
    63
           geom boxplot()+
           labs(
    64
              title = "Waiting times by staff level",
    65
              v = "Waiting time"
    66
    67
    68
    69
    70
         ggsav
    71
                                     ggsave(filename, plot = last plot(), device = NULL, path =
           ggsave
                                        NULL, scale = 1, width = NA, height = NA, units =
    73
                                        c("in", "cm", "mm"), dpi = 300, limitsize = TRUE, ...)
    74
                                     ggsave () is a convenient function for saving a plot. It defaults to saving
    75
                                     the last plot that you displayed, using the size of the current graphics
    76
                                     device. It also guesses the type of graphics device from the extension.
    77
                                     Press F1 for additional help
